

Dimension®

SPECIALTY HERBICIDE

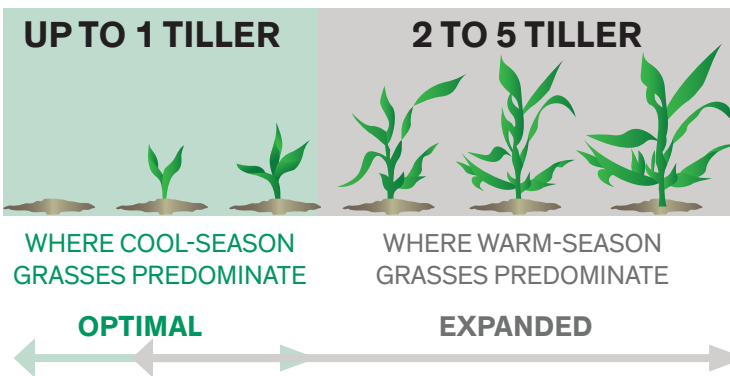

AN EFFECTIVE SOLUTION FOR POST-EMERGENT CRABGRASS CONTROL

Dimension® specialty herbicide is the leading turf and ornamental herbicide providing pre- and early post-emergent control of crabgrass. And while optimum early post-emergent crabgrass control is obtained when Dimension is applied prior to tillering (up to 5 leaves), new research shows great control can still be achieved even when Dimension is applied in the early tillering stages

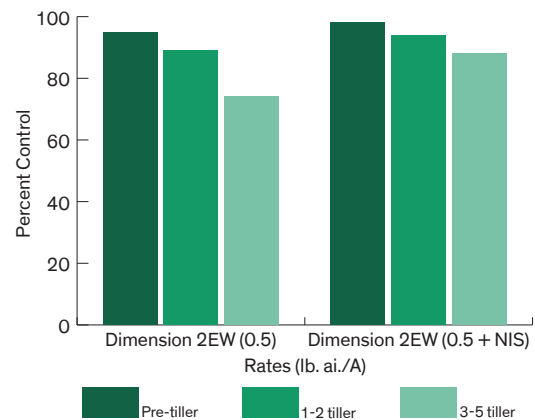

Expanded Window of Application

By providing both pre- and post-emergence crabgrass control, Dimension has always provided a longer application window than products that provide only pre-emergent control. But now, research shows this window of application has been expanded even more.

In warm-season turgrasses, Dimension can be applied through the 3 to 5 tiller stage.

Post-emergent Application of Dimension Specialty Herbicide at Various Stages

Note: Post emergent crabgrass control is improved with the addition of an NIS surfactant, with the most noticeable improvements being observed at the later stages of growth.

KEY FACTS:

- Exceptional turf and ornamental safety
- Application flexibility and non-staining formulations
- Available in multiple formulations
 - Liquid, WSP and granule
