

Eagle®

SPECIALTY FUNGICIDE

With Eagle® 0.39% Granular Turf Fungicide, you can cure dollar spot and brown patch. Better yet, you can prevent them and other diseases from occurring in the first place. Eagle 0.39% Granular Turf Fungicide has preventive and curative qualities that make it one of the broadest spectrum fungicides available.

How Eagle® 0.39% Granular Turf Fungicide Works

Eagle 0.39% Granular Turf Fungicide is a systemic fungicide whose active ingredient, myclobutanil, inhibits the synthesis of ergosterol, an important component of fungus cell walls. Myclobutanil, a demethylation inhibitor (DMI), hinders sterol synthesis, which restricts cell wall development in targeted pathogens. Eagle 0.39% Granular Turf Fungicide works from the inside out and, unlike some other locally systemic products, it protects new foliage by translocating to new growth. Eagle 0.39% Granular Turf Fungicide does not display the plant growth regulator effects often found in similar products – so it should not inhibit growth and development of turf.

Diseases Controlled

Eagle 0.39% Granular Turf Fungicide offers both protective and curative activity on more than 15 turf diseases, including:

- Brown patch
- Copper spot
- Dollar spot
- Necrotic ring spot
- Summer patch

Turf Recommendations

Low use rates and changes in the availability of fungicides labeled for use in lawn care applications combine to make Eagle 0.39% Granular Turf Fungicide a desirable alternative for a wide range of turf species in commercial, residential and golf course applications. These include bluegrass, Bermudagrass, zoysiagrass and bentgrass (fairways and greens).

How to Apply

The best control of labeled diseases is achieved when Eagle 0.39% Granular Turf Fungicide is applied on a seven- to 14-day schedule. See label for recommended rates to match your disease risks.

Key Benefits

- Prevents and cures fungal diseases.
- Systemic protection that protects new growth.
- Well tolerated by popular turfgrass species.
- Convenient granular formulation.
